

Abstract Submitted for the 52nd Annual Meeting
Division of Plasma Physics
November 08–12, 2010, Chicago, Illinois

Category Number and Subject: 6.1.3 Plasma Control Systems or 5.6.2 DIII-D Tokamak

Theory Experiment

Closed-Loop Simulation of Model-Based Current Profile Control with the DIII-D Plasma Control System,* Justin Barton, Eugenio Schuster, *Lehigh University*; M.L. Walker, D.A. Humphreys, *General Atomics* – Current profile control has proven to be a critical requirement for advanced operating scenarios with improved confinement and possible steady-state operation. Limitations exhibited by non-model-based controllers tested at DIII-D motivated the design of model-based controllers that account for the dynamics of the q profile evolution. A control-oriented model of the current profile evolution in DIII-D was recently developed and used to design both open-loop and closed-loop control schemes. In this work, we report on the design and implementation of these advanced model-based controllers in the DIII-D Plasma Control System (PCS) and on the evaluation of these controllers by connecting the PCS to a simulation of the current profile evolution represented by a magnetic diffusion equation.
