Feedback Stabilization of the Resistive Wall Mode (RWM) in DIII-D¹

G.A. NAVRATIL, J. BIALEK, A.M. GAROFALO, Columbia University, R.J. LA HAYE, E.J. STRAIT, J.T. SCOVILLE, General Atomics, E.A. LAZARUS, Oak Ridge National Laboratory, E.D. FREDRICKSON, L.C. JOHNSON, M. OKABAYASHI, Princeton Plasma Physics Laboratory, M. GRYAZNETICH, UKAEA Fusion — Initial experiments studying feedback stabilization of the RWM in DIII-D were carried out in plasmas above the no-wall β -limit for ideal $n = 1$ kink modes, where the RWM has been observed. The feedback system consists of six driven saddle coils on the midplane, each covering 60° in toroidal angle, and powered as three independent $n = 1$ pairs. Under each driver coil is a saddle coil sensor to monitor the radial magnetic flux through the vacuum vessel. Application of “smart shell” and “fake rotating shell” feedback algorithms have demonstrated that the radial field soaking through the vacuum vessel can be controlled, the RWM amplitude can be reduced, and the plasma duration at high β extended in agreement with the 3D feedback simulation VALEN.

¹Supported by U.S. DOE Grant DE-FG02-89ER53297 and Contracts DE-AC03-99ER54463, DE-AC05-96OR22464, and DE-AC02-76CH03073 and by the U.K. Dept. of Trade & Industry and EURATOM.
